

What is claimed is:

1. A three-dimensional model analyzing apparatus for analyzing a physical property of a three-dimensional model, comprising:

5 an information receiving unit which receives information on a three-dimensional model as an object to be analyzed;

 an edge detecting unit which detects an edge of said three-dimensional model;

10 a smoothing unit which smoothes said edge; and
 an analyzing unit which analyzes said three-dimensional model in accordance with a finite element method after said edge is smoothed by said smoothing unit.

15 2. A three-dimensional model analyzing apparatus according to claim 1, wherein said edge detecting unit detects only at least one edge having an angle which does not exceed a predetermined amount.

20 3. A three-dimensional model analyzing apparatus according to claim 1, wherein said smoothing unit transforms said edge into a curved surface having a predetermined radius of curvature.

25 4. A three-dimensional model analyzing apparatus according to claim 3, wherein said analyzing unit analyzes said three-dimensional model in accordance with the finite

element method after dividing the three-dimensional model into a plurality of hexahedral elements which are formed with edges each having a length shorter than said predetermined radius of curvature.

5

5. A three-dimensional model analyzing apparatus according to claim 4, further comprising a number-of-divisions varying unit which varies the number of said plurality of hexahedral elements,

10 said analyzing unit determines a converged value of said physical quantity based on a local maximum of calculated values of said physical quantity which are obtained while increasing the number of said plurality of hexahedral elements by said number-of-divisions varying
15 unit.

6. A computer-readable storage medium storing a program which makes a computer execute a process for analyzing a physical property of a three-dimensional model,
20 said program further makes said computer realize:

an information receiving unit which receives information on a three-dimensional model as an object to be analyzed;

an edge detecting unit which detects an edge
25 of said three-dimensional model;

a smoothing unit which smooths said edge; and

an analyzing unit which analyzes said three-

dimensional model in accordance with a finite element method after said edge is smoothed by said smoothing unit.
